LearnEasy

A simple, student-friendly educational learning app

APP PROPOSAL	WEEK 1 DELIVERABLE
Prepared by	Ebenezer Arthur
Project type	Educational mobile application (Flutter)
Primary users	Students / learners; secondary user: teacher or administrator
Design principle	Simple navigation, readable content, short learning sessions

Project idea

LearnEasy is a learning hub designed to help students find lessons quickly, understand key ideas in manageable steps, and check their understanding through short quizzes. The first version focuses on Mathematics, Science, and English Language, with a layout that can be expanded to other subjects and class levels.

1. App purpose and vision

Purpose. To make independent study easier by putting subject topics, short lesson notes, and quick practice in one clear place. The app should feel welcoming to students who may not be confident with complicated technology.

Vision. A lightweight learning companion that students can navigate without needing lengthy instructions. The interface uses clear labels, familiar icons, consistent buttons, and short text sections.

2. Problem being addressed

Students may have difficulty finding organised learning materials, knowing what to study next, or checking whether they understood a topic. LearnEasy addresses this by grouping content by subject, displaying lesson titles and estimated time, and providing a quick quiz for practice.

3. Target users

Primary users — students: learners who need a straightforward way to browse topics, read lesson notes, practise questions, and monitor their learning activity.

Secondary users — teachers/administrators: a future admin role can add or update subject titles, lessons, quiz questions, and learning resources. For the first prototype, admin content management is planned rather than fully implemented.

4. Objectives

• Make core learning actions accessible within a few taps.

• Organise content into subjects and individual lessons.

• Present explanations in short, readable sections with examples.

• Provide low-pressure quizzes with immediate feedback.

• Give students a simple view of learning progress.

• Design the structure so new subjects and class levels can be added later.

5. Planned features

Feature	How it helps
Student sign-in / profile	A simple account entry point and learner profile. In a production version, protect accounts and personal data.
Dashboard	Quick overview, featured subjects, lesson count, and an obvious next action.
Subject library	Subject cards with descriptions and a clear “View lessons” action.
Lesson reader	Topic title, short explanation, worked example, and link to practice.
Quick quiz	Multiple-choice questions, instant feedback, and a running score.
Search	Search by subject or lesson title to reduce time spent navigating.
Progress summary	A basic record of quiz points and lesson activity; more detailed tracking can be added later.
Admin content management (planned)	Authorised staff can create, edit, and organise lessons and questions.

6. Navigation flow

Student flow: Open app → Sign in / continue → Dashboard → Choose subject → Choose lesson → Read explanation/example → Take quick quiz → View feedback/score → Return to lesson library.

Teacher/admin flow (planned): Sign in with authorised role → Admin dashboard → Manage subjects → Add or edit lesson content → Add quiz questions → Preview changes → Publish updates.

Navigation is kept consistent: Dashboard, My Subjects, Lessons, and Profile/Progress. A visible back action is available on lesson details so students do not feel trapped in a screen.

7. Short user journey examples

Journey A — student learning a topic: Ama opens LearnEasy on her phone. The dashboard shows Mathematics, Science, and English Language. She taps Mathematics, selects “Understanding fractions,” reads the explanation and example, then opens the quiz. After answering, she sees whether her answer is correct and can return to the lesson list.

Journey B — student revising quickly: Kojo uses the search box and types “nouns.” The app shows the English Language lesson “Parts of speech: nouns.” He opens it, reviews the definition and examples, and completes a short question to check his understanding.

Journey C — teacher/admin content update (planned): A teacher signs in with an authorised account, opens the content area, updates a lesson explanation, adds a practice question, previews the lesson, and publishes it for learners.

8. Accessibility and usability choices

• Readable font sizes and strong contrast between text and backgrounds.

• Plain language, short paragraphs, and familiar icons supported by text labels.

• Large touch targets suitable for phone screens.

• Responsive layout for small and large screens.

• Immediate quiz feedback that explains the correct idea, not only a score.

• Avoid collecting unnecessary personal information; secure authentication is required before real deployment.

9. Initial content and scope

The prototype starts with three subjects: Mathematics (fractions and percentages), Science (living/non-living things and states of matter), and English Language (nouns and sentence building). This sample content demonstrates the structure only; a complete app should have its learning content reviewed against the relevant school curriculum and age group.

10. Suggested technology and project structure

Mobile framework: Flutter and Dart. **Initial storage:** sample content embedded locally to make the first prototype easy to demonstrate. **Future backend:** Firebase or another secure service for authentication, content storage, and progress synchronisation.

Suggested repository structure:

learneasy_flutter/ • lib/main.dart • assets/ • test/ • README.md • pubspec.yaml • .gitignore

11. Success criteria

• A new student can reach a lesson from the dashboard in three or fewer taps.

• Each lesson has a title, explanation, and at least one example or key idea.

• A quiz displays feedback after an answer and updates the score.

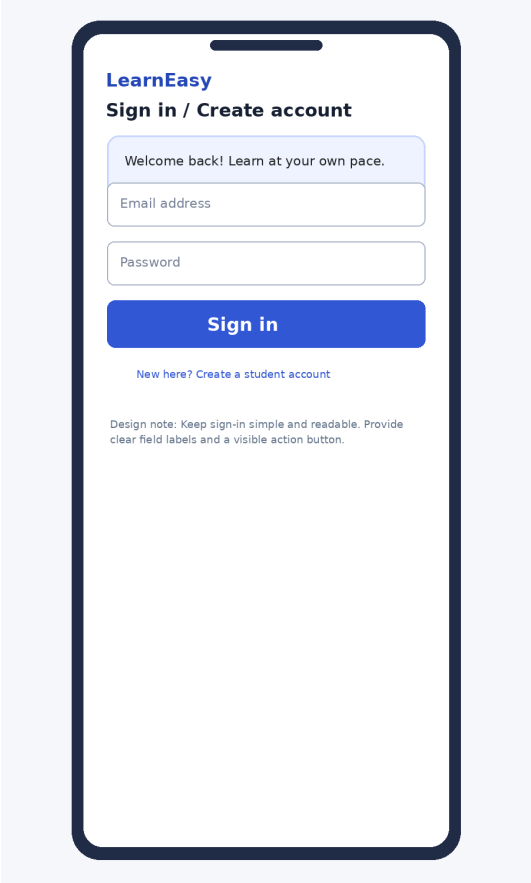

• Navigation works on common mobile screen sizes.

• The README explains the app idea, setup steps, and main navigation flow.

12. Low-fidelity wireframes

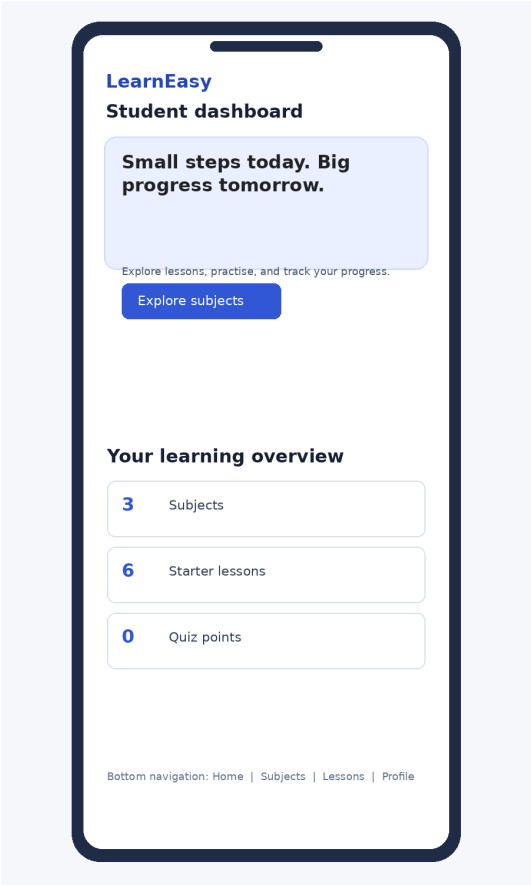

These sketches show the core screen layout before visual styling and full development. They are intentionally low-fidelity and focus on placement, navigation, and the information students need.

Screen 1 — Sign in / Create account

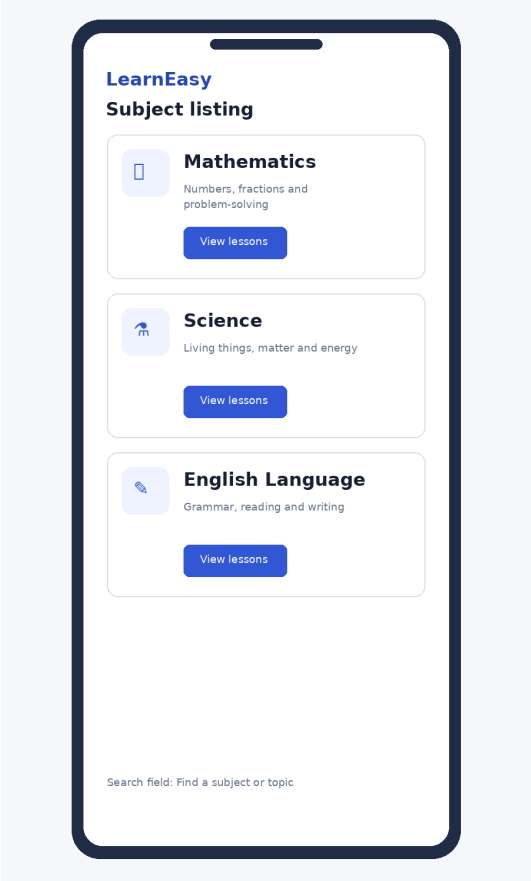

Email and password fields, a clear sign-in button, and a path for new learners.

Screen 2 — Student dashboard

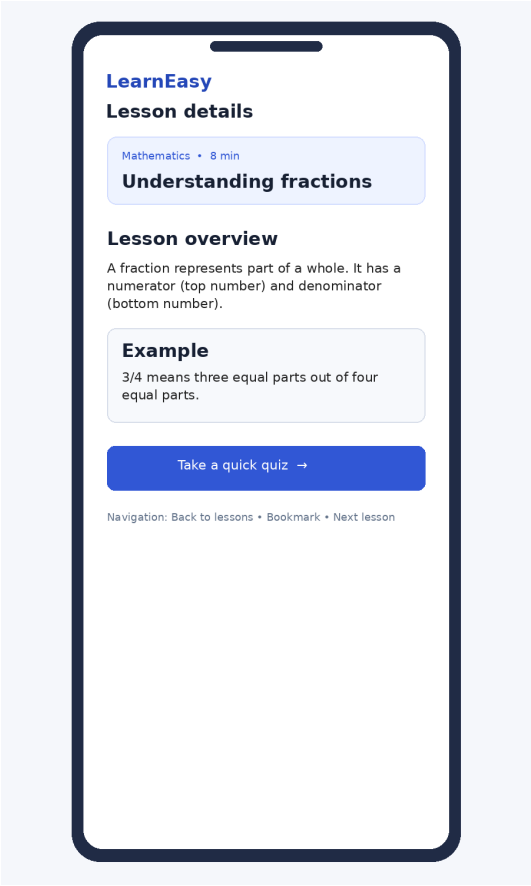

A welcome message, primary action, learning overview, and consistent bottom navigation.

Screen 3 — Subject listing

Subject cards include a simple description and a clear route to lessons.

Screen 4 — Lesson details

Lesson title, estimated time, explanation, example, and a quiz action.

13. Limitations and next steps

This Week 1 submission defines the concept and core user experience. The wireframes are planning artefacts, not final UI designs. The Flutter folder included with this submission is a starter structure; connect a real authentication provider, persistent database, admin permissions, and curriculum-verified content before releasing to students.

Next steps: (1) create the GitHub repository, (2) commit the initial Flutter project and README, (3) implement the screens in Flutter, (4) test with a small group of students, and (5) improve based on their feedback.

14. GitHub repository

Proposed repository name: **learneasy-student-learning-app**. The README is included in the accompanying project folder. Once the repository is created and the files are pushed, paste the actual repository link here: **[Insert your GitHub repository URL after pushing]**.

Version-control evidence: a real commit/push must be made from your own GitHub account. Do not claim a repository has been created until the files have been pushed. The included README gives the commands to initialise Git and push the starter project.

Prepared as a Week 1 app proposal for the LearnEasy educational app concept.
